

# Quality Management

- Evaluation of satisfaction in everyday working routine of different professional groups before and after introducing quality management
- Service offer in primary health care hospitals before and after introducing the DRG system
- Improvement of patient care by routinely assessment of SAPS II and APACHE in the intensive care ward
- Improvement of the satisfaction of patients and GPs by standardised medical reports
- Satisfaction of patients and GPs in a large hospital – which approaches regarding optimization can be identified?
- Objectification of selection criteria of medical students – which factors identify a successful graduate?
- Acceptance of quality management by leading qualified teachers – a survey throughout Germany
- Evaluation of new concepts integrating community nurses in GP practices – effects on quality of diagnostics and therapy
- Range of services in different statutory health insurances – analysis of preventive programmes
- Analysis of sources of error in perfusion and pump systems in university clinics – can improvements after the optimisation of quality management be proven?
- Preoperative predictors for the identification of complicated intubations before elective surgery – avoidance of complications in elective intubations
- Influence of quality management in bariatric surgery on postoperative processes
- Influence of composition and experience of the OP team on efficiency and OP results
- GP care before and after changes in liquidation options – range of service and quality of treatment in times of rationalisation
- Quality management and GCP-according implementation of clinical studies with medical products
